

## **Product information**

**Product name:** Gaeumannomyces graminis detection reagent set

**Product number:** EG-2

Package size: 5 tests

General description: Gaeumannomyces graminis is pathogenic on many members of the

Poaceae family, but is most commonly a problem on wheat, barley, rye, oats and turf grass. *G. graminis* var. *tritici* is the form of the fungus that attacks wheat and related species, whereas *G. graminis* var. *avenae* attacks oats and *G. graminis* var. *graminis* is problematic on turf and other grasses. Since the pathogen takes all of the grain and leaves an obvious 'white head' that is empty of seed, the disease it produces is

commonly known as Take-all.

**Principle:** The Gaeumannomyces graminis detection reagent set is sensitive and

easy to handle test for the detection of *Gaeumannomyces graminis*. The test can be carried out without sample preparation or pre-incubation. Since the test does not require any labour equipment, it s especially

suitable for analysis on the spot.

Sensitivity: Detection limit 1 ng

Sample size: max. 1 ml

Assay sample type: any sample

**Detection time:** 1.5 h
